## Adding and Subtracting

### STEP 1:

Make the fractions IMPROPER fractions

$3\frac{1}{2}$  This is a PROPER fraction. If I cut four cookies into halves, and you eat three and a half cookies, you just ate SEVEN HALVES ( $7/2$ )

$7/2$  is an IMPROPER fraction. We need to talk Improper Fractions in this unit.

How do we convert them?

$3\frac{1}{2}$  Multiply the DENONIMATOR (bottom number) by the WHOLE NUMBER (front number) and then ADD the NUMERATOR (top number):  $2 \times 3 + 1 = 7$

$\frac{7}{2}$  is the new improper fraction. It MEANS the same thing, it's just a drunk way of wording it.

Example:

$2\frac{3}{8}$   $8 \times 2 + 3 = 19$  so....

$\frac{19}{8}$  is the new improper fraction; it's still the SAME fraction.

### STEP 2:

Make the DENOMINATORS the same

$\frac{4}{3} + \frac{1}{3}$  Easy. Add the tops,  
keep the bottoms the same

$$\frac{4}{3} + \frac{1}{3} = \frac{5}{3} = \boxed{1\frac{2}{3}}$$

Notice I turned  $5\frac{2}{3}$  into a proper fraction. How many 3's can I pull out of 5? **1**. If I pull one 3 out of a 5, how much is left behind? **2**

That becomes "One and two thirds"

If the DENOMINATORS are DIFFERENT, multiply each by the other, Top AND Bottom.

THEN add ONLY the tops; keep the bottoms the SAME.

$$3 \times \frac{9}{5} + \frac{1}{3} \times 5 = \frac{27}{15} + \frac{5}{15} = \frac{32}{15} = 2\frac{2}{15}$$

NOTE: I can pull TWO 15's out of 32, leaving 2 behind.

What about Subtracting?

Same thing.

$$4\frac{1}{6} - \frac{9}{5}$$

$$5 \cdot \frac{25}{6} - \frac{9 \cdot 6}{5 \cdot 6}$$

$$\frac{100}{30} - \frac{54}{30}$$

$$\frac{46}{30} = 1\frac{16}{30} = 1\frac{8}{15}$$

Step 1: Make all fractions IMPROPER Fractions

$$(6 \times 4 + 1 = 25)$$

Step 2: Make DENOMINATORS the same

(Multiply tops AND bottoms)

Step 3: Subtract TOPS

Step 4: Convert to PROPER fraction

(How many 30's can I get out of 46?  
How much is left?)
