

# LAB – Chassis Inspection

Students: 1. \_\_\_\_\_  
 2. \_\_\_\_\_  
 3. \_\_\_\_\_

Date: \_\_\_\_\_  
 Block: \_\_\_\_\_

Fill in each box with the appropriate information.

Be sure to have the Instructor’s initials before moving on to the next step. These are there to ensure everything is SAFE and CORRECT. Each team member must be able to answer questions from your instructor to receive credit for this lab.

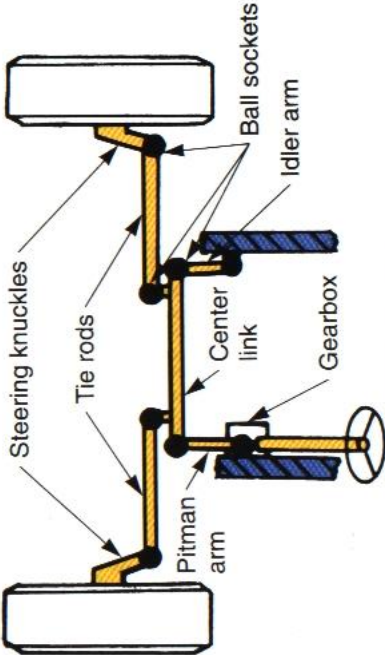

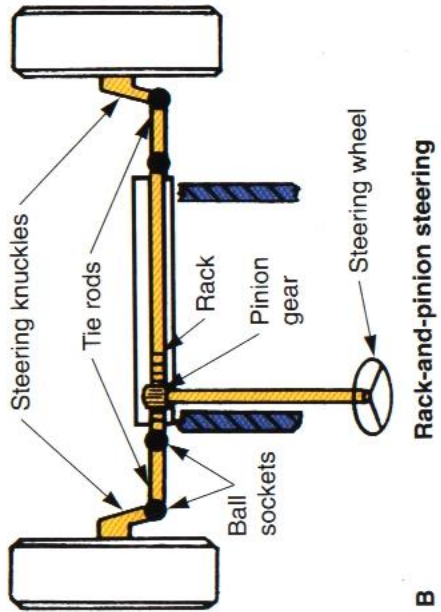

VEHICLE IDENTIFICATION		
Year:		Make:
Model:		Mileage:
VIN Number:		
RAISE THE VEHICLE		
<ul style="list-style-type: none"> <li>- For this lab, the vehicle will need to be raised off the ground.</li> <li>- While a floor jack and jack stands will work, a hoist is the best method.</li> <li>- You will also need a trouble light to see everything clearly</li> </ul>		
		
<p><b>Floor Jack &amp; jack Stands:</b></p> <ul style="list-style-type: none"> <li>• Check with your Instructor for the correct placement of the jack and jack stands.</li> <li>• Lifting and/or supporting in the wrong place can cause serious damage</li> </ul> <div style="text-align: center;">  <p>Jack Stands</p> </div>	<p><b>4-Post Hoist:</b></p> <ul style="list-style-type: none"> <li>• Vehicle in gear or park</li> <li>• Emergency brake is set</li> <li>• Wheels are chocked</li> <li>• Hoist is raised to a comfortable height</li> <li>• Rest on the locks</li> </ul> <div style="text-align: center;">  <p>4-Post</p> </div>	<p><b>2-Post Hoist:</b></p> <ul style="list-style-type: none"> <li>• Position the car correctly for best balance</li> <li>• Position arms; get me to check</li> <li>• Lock arms</li> <li>• Lift slightly and check balance and stability</li> <li>• Raise to a comfortable height</li> <li>• Rest on the locks</li> </ul> <div style="text-align: center;">  <p>2-Post</p> </div>
<b>STOP!!!</b>		<b>INSTRUCTOR’S INITIALS:</b>

**STEERING**

**IDENTIFICATION**

What type of steering system does this vehicle have (circle)?

[LINKAGE/PARALLELOGRAM]                      [RACK & PINION]

**A**                      **B**

**STEERING**

Your steering system has (#) \_\_\_\_\_ joints where wear & play can occur.

Gently move the steering wheel back and forth, looking for play in ANY joint or connection in the steering system. ANY movement in ANY joint is bad.

Squeeze the tie rods by your hand. Any perceivable play is bad.

Play found in the following joints:

How much play is noticed in the steering wheel before the wheels even start to move?

Millimeters of movement at the wheel: \_\_\_\_\_

**STOP!**                      **INSTRUCTOR'S INITIALS:**

**TIRE WEAR**

	Rapid wear at shoulders	Rapid wear at center	Cracked treads	Wear on one side	Feathered edge	Bald spots	Scalloped wear
CONDITION	1. 						
CAUSE	Underinflation or lack of rotation	Overinflation or lack of rotation	Underinflation or excessive speed	Excessive camber	Incorrect toe	Unbalanced wheel or tire defect	Lack of rotation of tires or worn or out of alignment suspension
CORRECTION	Adjust pressure to specifications when tires are cool, rotate tires			Adjust camber to specifications	Adjust toe-in to specifications	Dynamic or static balance wheels	Rotate tires and check alignment

Wear found in the tires (there might be more than one wear pattern happening):

**SUSPENSION**

Label the appropriate picture with an **F** for **Front**, and **R** for **Rear**

Live axle with leaf spring	Trailing arm	Twin I-beam
Solid axle, coil spring, panhard bar	Triangulated 4-link (Satchell)	Live axle with DeDion
MacPherson strut	Double-Wishbone	Double-Wishbone (also)

**BUSHINGS**

Bushings are usually rubber. They can don't last forever. You will find them wherever anything moves. Look for cracks, missing, wear/elongation, etc.

Damage/Wear you found:

**SWAY BARS**

Sway bars improve handling by preventing the body from leaning over in a corner. You may have a front and rear bar, you may have a front bar only, or you may have no bars at all.

The bars do not wear out, but the end links do.

Damage/Wear you found:

**STOP! INSTRUCTOR'S INITIALS:**

**SHOCKS/STRUTS**

Almost all shock absorbers and MacPherson struts today are oil-filled and gas pressurized.

The oil is what damps the spring motion, and the gas charge helps prevent the oil from aerating (bubbles).

Shocks are vital to a car's control and stability. Worn shocks should ALWAYS be replaced in pairs – if one is bad, the other is probably not far behind and mismatched shocks may behave unsafely.

**INSPECT**

Oil leaking from the top of a shock means its oil seals are blown, and the shock is worn out

Leaks  
[Front]: \_\_\_\_\_ [Rear]: \_\_\_\_\_

A shock that cannot control the spring means its valving is blown, and the shock is worn out

Bounce the car, and watch it come to a stop. Number of continued bounces?  
[Front]: \_\_\_\_\_ [Rear]: \_\_\_\_\_

**SPRINGS**

The springs support the vehicle, not the shocks.

All springs can fatigue, bend and break.

Leaf spring packs sometimes wear the leaves out by rubbing together over years of use.

Torsion bars have the advantage of being adjustable.

<b>FRONT</b>	Type of spring:	Ride height (ground to fender edge): _____ inches Any broken coils or leaves: [Yes] [No]
<b>REAR</b>	Type of spring:	Ride height (ground to fender edge): _____ inches Any broken coils or leaves: [Yes] [No]

Uneven ride height often indicates sagging springs. Which springs appear to be sagging?

**STOP!**

**INSTRUCTOR'S INITIALS:**

**BALL JOINTS**

**FIGURE 1**

**RAISING POSITIONS FOR SUSPENSION SYSTEMS**

**FIG**

Strut cars are checked by supporting the vehicle by the chassis, and prying the wheel up/down and side/side to check for play. Double-wishbone cars are checked by supporting the car by the control arm, and prying the wheel up/down/side/side to check for play.

Demonstrate checking the ball joints to your instructor.

**STOP!!!**

**INSTRUCTOR'S INITIALS:**

If the car had a tendency to wander, what are three likely causes?

- 1.
- 2.
- 3.

If the car had a tendency to "float" after hitting bumps, what is the most likely cause?
